

## 1. Source Code Details

**Primary Program File:** `app.py`

**Core Framework:** Streamlit

## 2. Key Functions & Widget Breakdown

- `st.set_page_config(...)`: Defines browser window title, favicon, and centers page layout.
- `st.columns(2)`: Creates a balanced 2-column responsive layout for compact form entry.
- `st.number_input(...)`: Bounded integer and floating-point numeric input fields with step constraints.
- `st.selectbox(...)`: Dropdown selectors ensuring clean discrete categorization of diet and goal.
- `st.button(...)`: Listens for submission events and executes block conditional statements.
- `st.markdown(...)`: Renders formatted, multi-line structured Markdown output for exercise and diet tables.

## 3. Code Execution Flow

The Python script executes top-to-bottom on initial load. When user inputs change or the submit button is triggered, Streamlit re-executes the script reactively, dynamically updating the output view without needing full page reloads.
