

1. Project Conclusion

FitBuddy provides an accessible, responsive, and easy-to-use digital platform for personal fitness and diet routine generation. By integrating Python and Streamlit, the application demonstrates efficient rapid UI prototyping, robust input validation, and conditional rule-based data delivery.

2. Future Enhancements & Roadmap

- **AI / LLM Integration:** Integrating OpenAI GPT-4 or Google Gemini API to produce hyper-personalized, dynamically adaptive nutrition and workout advice based on medical history.
- **Automated PDF Export:** Implementing a single-click PDF generation button allowing users to download their customized meal and exercise schedules.
- **User Profiles & Authentication:** Integrating database persistence (e.g., SQLite / PostgreSQL) to allow users to create profiles, track weight progression, and log daily calories.
- **Wearable Device Synchronization:** Connecting with fitness API ecosystems (Google Fit, Apple Health) for automated activity tracking.
